Characterization Acres: 6830 acres

Acreege Description:

Although OE will be concentrated around the target, evidence of bombing is almost always found beyond the scoring arcs. OE debris is typically found throughout the entire property and on occasion beyond the property boundaries. The Characterization Acreege was calculated to extend beyond the target center 3000 feet, for a total of 649 acres $[(\text{Pi} * (3,000)^2) / 5280^2 * 640]$.

The use of rockets on this site complicates the calculation of the AOC in that the 3.5-inch rockets had a maximum range of 4,400 yards or 13,200 feet. Without a defined line of attack this was estimated to be circular or 12,566 acres, (which is similar in size to current air force guidance on impact footprint for rockets).
